tracking.js

tracking.js About Examples Download now Fork on Github

tracking.js

Change the way you interact with your browser

Download now Fork on Github

Example

Basic Usage

This example is a simple way to initialize the user browser camera and start tracking for objects with color **magenta**. There are two available callbacks, `onfound` is fired when the object is detected and `onlost` fires the opposite. The `onframe` callback receives as argument a track.

```
var VideoCamera = new tracking.VideoCamera().render().renderVideoCanvas();  
  
videoCanvas.track({  
  type: 'color',  
  color: 'magenta',  
  onfound: function(track) {  
    console.log('track.x, track.y, track.z');  
  },  
  onlost: function() {}  
});
```

tracking.js

Tracking library for the web

Common infrastructure to develop visual tracking applications and to accelerate the use of those techniques on the web in commercial products.

Library features

1. Color tracking

Library features

2. Rapid object detection (Viola Jones)

Library features

3. Markerless tracking algorithm

Color tracking algorithm

Figure : © <http://www.flickr.com/photos/laynecom/8674644879/>

Color tracking algorithm

```
1 var videoCamera = new tracking.VideoCamera();
2 videoCamera.track({
3     type: 'color',
4     color: 'magenta',
5     onFound: function(track) {
6         // do your logic here.
7     }
8});
```

Color tracking algorithm - Color difference evaluation

$$\|C_1 - C_2\| = \sqrt{(C_{1,R} - C_{2,R})^2 + (C_{1,G} - C_{2,G})^2 + (C_{1,B} - C_{2,B})^2}$$

Color tracking algorithm - Color blob detection

Rapid object detection (Viola Jones)

Rapid object detection (Viola Jones)

```
1 var videoCamera = new tracking.VideoCamera();
2 videoCamera.track({
3     type: 'human',
4     data: 'frontal_face',
5     onFound: function(track) {
6         // do your logic here.
7     }
8});
```

Rapid object detection (Viola Jones)

Rapid object detection (Viola Jones)

Integral Image

Rectangle features can be computed very rapidly using an intermediate representation for the image which we call the integral image.

The integral image at location x, y contains the sum of the pixels above and to the left of x, y , inclusive

$$ii(x, y) = \sum_{x' \leq x, y' \leq y} i(x', y')$$

Rapid object detection (Viola Jones)

Rapid object detection (Viola Jones)

Scanning detector algorithm

Rapid object detection (Viola Jones)

Scanning detector algorithm

- 1 Create or scale a 20×20 squared block by 1.25 per iteration

Rapid object detection (Viola Jones)

Scanning detector algorithm

- 1 Create or scale a 20×20 squared block by 1.25 per iteration
- 2 Loop the block by Δ pixels over the image

Rapid object detection (Viola Jones)

Scanning detector algorithm

- 1 Create or scale a 20×20 squared block by 1.25 per iteration
- 2 Loop the block by Δ pixels over the image
- 3 For each block location, loop the tree and evaluate each stage

Rapid object detection (Viola Jones)

Scanning detector algorithm

- 1 Create or scale a 20×20 squared block by 1.25 per iteration
- 2 Loop the block by Δ pixels over the image
- 3 For each block location, loop the tree and evaluate each stage
- 4 Positive stage evaluate next stage, otherwise stops the loop

Rapid object detection (Viola Jones)

Scanning detector algorithm

- 1 Create or scale a 20×20 squared block by 1.25 per iteration
- 2 Loop the block by Δ pixels over the image
- 3 For each block location, loop the tree and evaluate each stage
- 4 Positive stage evaluate next stage, otherwise stops the loop
- 5 If all stages were positive store the rectangle

Rapid object detection (Viola Jones)

- 1 Create or scale a 20×20 squared block by 1.25 per iteration
- 2 Loop the block by Δ pixels over the image
- 3 For each block location, loop the tree and evaluate each stage
- 4 Positive stage evaluate next stage, otherwise stops the loop
- 5 If all stages were positive store the rectangle
- 6 Once the tree is done, group the overlapping rectangles

Rapid object detection (Viola Jones)

Scanning detector algorithm

- 1 Create or scale a 20×20 squared block by 1.25 per iteration
- 2 Loop the block by Δ pixels over the image
- 3 For each block location, loop the tree and evaluate each stage
- 4 Positive stage evaluate next stage, otherwise stops the loop
- 5 If all stages were positive store the rectangle
- 6 Once the tree is done, group the overlapping rectangles
- 7 Find the best rectangle of each the group (merging phase)

Rapid object detection (Viola Jones)

1. Optimization: merging phase

Rectangles are used partitioned into a disjoint set data structure.
On this work it was replaced by an alternative called Minimum Neighbor Area Grouping.

Rapid object detection (Viola Jones)

1. Optimization: merging phase

Rectangles are used partitioned into a disjoint set data structure. On this work it was replaced by an alternative called Minimum Neighbor Area Grouping.

2. Optimization: training data

OpenCV uses XML to store training data. This work proposes the usage of row-major order typed arrays.

```

Feature detector (FAST)

Feature detector (FAST)

Feature detector (FAST)

1. Optimization: avoid machine learning

The steps required for machine learning involves extra math operations, such as *log*. The results were good without it.

Feature detector (FAST)

1. Optimization: avoid machine learning

The steps required for machine learning involves extra math operations, such as *log*. The results were good without it.

2. Optimization: avoid non-maximal suppression

To remove corners which have an adjacent corner requires extra access to the typed array.

Feature extractor (BRIEF)

Feature extractor (BRIEF)

To generate the binary strings it is defined the test τ on patch \mathbf{p} of size $\mathbf{S} \times \mathbf{S}$ as:

$$\tau(\mathbf{p}; x, y) := \begin{cases} 1 & \text{if } \mathbf{p}(x) < \mathbf{p}(y), \\ 0 & \text{otherwise} \end{cases}$$

Feature extractor (BRIEF)

The n_d -dimensional bit-string is our BRIEF descriptor for each keypoint:

$$f_{n_d}(\mathbf{p}) := \sum_{1 \leq i \leq n_d} 2^{i-1} \tau(\mathbf{p}; x, y).$$

In this work $n_d = 128$ was used. The number of bytes required to store the descriptor can be calculated by $k = n_d/8$.

Feature extractor (BRIEF)

Feature extractor (BRIEF)

The weighted Hamming distance is computed by:

$$WHam(x, y) = \sum_{i=1}^n w_i(b_i(x) \otimes b_i(y))$$

$$b_1 = 0000000001\dots$$

$$b_2 = 0000000011\dots$$

$$b_1 \otimes b_2 = 0000000010\dots$$

$$WHam = 1$$

Feature extractor (BRIEF)

1. Optimization: avoid smoothing kernels

By pre-smoothing the patch, increases the stability and repeatability of the descriptors, but decreases performance.

Feature extractor (BRIEF)

1. Optimization: avoid smoothing kernels

By pre-smoothing the patch, increases the stability and repeatability of the descriptors, but decreases performance.

2. Optimization: avoid Gaussian distribution

Computing the Gaussian distribution can be time consuming.
Simply replaced by a uniform version of JavaScript Math.random().

Homography estimation

Random sample consensus (RANSAC)

RANSAC (Random Sample Consensus) is an iterative method to estimate parameters of a mathematical model from a set of observed data which contains outliers. It is the most commonly used robust estimation method for homographies.

Website

The screenshot shows the homepage of the tracking.js website. At the top, there are navigation links for "tracking.js", "About", and "Examples". On the right, there are buttons for "Download now" and "Fork on Github". The main title "tracking.js" is prominently displayed in a large, bold font, with the tagline "Change the way you interact with your browser" underneath. Below the title is a video thumbnail showing a person interacting with a tracked object on a screen. At the bottom of the page, there is a section titled "Example" with a code snippet for "Basic Usage". The code uses the `tracking.VideoCamera` constructor to initialize a camera and start tracking objects with color `magenta`.

```
var VideoCamera = new tracking.VideoCamera().render().renderVideoCanvas();
VideoCamera.track([
  type: 'color',
  color: 'magenta',
  onFrame: function(frame) {
    console.log(frame.x, frame.y, frame.x2);
  },
  onLost: function() {}
]);
```
